# **GT5Y** Series Miniature Electronic Timers

# Four Selectable Operation Modes. Six Selectable Time Ranges. Delayed Output 4PDT/3A or DPDT/5A.

Package Quantity: 1

- Four operation modes: ON Delay, Interval ON, Cycle OFF, and Cycle ON
- Repeat error: ±0.2% ±20 ms maximum
- Miniature size
- LED indicators for output and power
- Complies with safety standards. UL/c-UL listed. EN compliant.

| Applicable Standards     | Mark                            | File No. or Organization          |
|--------------------------|---------------------------------|-----------------------------------|

| EN61812-1                | ()                              | EU Low Voltage Directive          |

Note: When using as a UL Listing approved product, use IDEC timer sockets under the below conditions.

SY4S-05\*, SM2S-05\* (Specify A, B, C, DF, DN, or U in place of \* )

- Wire conductor temperature rating: 60°C min.
- Copper wire only: AWG14 max. (2mm<sup>2</sup> max.), AWG14 max. (0.9mm<sup>2</sup> max.)
- Tightening torque: 0.6 to 1.0N·m

SU4S-11L, SU2S-11L

(1) Operation

Mode

A: ON Delay

**B: Interval ON** 

C: Cycle OFF

D: Cycle ON

• Wire conductor temperature rating: 60°C min.

Contact

DPDT

4PDT

• Copper wire only: AWG16 max. (solid wire 1.5mm<sup>2</sup> max., stranded wire 1.25mm<sup>2</sup> max.), AWG18 max. (0.9mm<sup>2</sup> max.)

Output

# **GT5P** Series Miniature Electronic Timers

# Economic Efficiency Focused Delayed Output SPDT/5A

- Three operation modes: ON Delay, Cycle, and One Shot
- Repeat error: ±0.2% ±10 ms maximum
- Complies with safety standards UL recognized, CSA certified, TÜV approved, EN compliant

| Insert the spring into<br>the inner slots with the<br>projection facing inside. |                    | Insert the springs<br>into the slots. |                                  |  |

Socket Hold-Down Spring SR2P-05B SFA-203 (2 pcs needed)

Note 1: Once installed into sockets, the hold-down springs cannot be removed. Note 2: Hold-down springs cannt be used on SR2P-511 for GT5P.

#### **Recommended Tightening Torque and Terminal Screw**

| Timer | Applicable Socket  | Terminal Screw | Recommended<br>Tightening Torque |
|-------|--------------------|----------------|----------------------------------|
| GT5P  | SR2P-05<br>SR2P-06 | M3.5           | 1.0 to 1.3 N·m                   |

#### Panel/PC Board Mount Socket

The SFA-302 Hold-Down Springs can be installed to the SY4S-51, SY4S-61, SM2S-51, and SM2S-61 sockets.

Hold-down springs cannot be installed to SR2P-511 and SR2P-70 panel mount sockets.

# Installation/Removal of Hold-Down Springs

(Installation)

Insert the hold-down springs (SFA-511) into mounting holes 1 and 2 with the projection facing outside.

#### (Removal)

Press the projections of Hold-Down Springs (SFA-511) in the direction shown in the arrow and pull upward to remove.

# Installation/Removal of Hold-Down Springs

#### (Installation)

Insert the springs (SFA-511) into mounting holes 1 and 2 with the projection facing outside.

#### (Removal)

Press the projections of Hold-Down Springs (SFA-511) in the direction shown in the arrow and pull upward to remove.

Note: Apply the same method to SY4S-05DF.

# A Safety Precautions

- Be sure to turn off power before mounting, removal, wiring, maintenance and inspection. Otherwise, electric shock or fire could occur.
- Be sure to use timers within rated specification values. Otherwise, electric shock or fire may occur.

### Instructions

#### **Time Range Setting**

The time range is calibrated at its maximum time scale, therefore it is desirable to use the timer at a setting as close to its maximum time scale as possible for accurate time delay. For a more accurate time delay, adjust the control knob by measuring the operating time with a watch before application.

On the GT5Y timers, a desired time range can be selected using the time range selectors on the side surface. Turn the multiplier and time unit selectors using a flat screwdriver until they click.

# **Timing Accuracy**

Timing accuracies are calculated from the following formulas:

#### Repeat Error

| = ± 🚽 | - × | Maximum anala unlua                     | × 100 (%) |  |
|-------|-----|---|-----------|--|
| 1     |     | Max measured value — Min measured value |           |  |

#### Voltage Error

 $= \pm \frac{Tv - Tr}{Tr} \times 100 \, (\%) \qquad Tv: \text{Average of measured values at voltage V} \\ \text{Tr: Average of measured values at the raged voltage}$ 

#### Temperature Error

 $=\pm \ \frac{Tt - T_{20}}{T_{20}} \times 100 \ (\%) \qquad \begin{array}{c} Tt: \mbox{ Average of measured values at } t^\circ C \\ T_{20}: \mbox{ Average of measured values at } 20^\circ C \end{array}$ 

#### Setting Error

= Average of measured values — Set value Maximum scale value × 100 (%)

# Use of External Input (GT5P-P Only)

- Do not apply voltage to external input terminals 3 and 4. Be sure not to connect external inputs to other terminals because the internal circuit may be damaged.
- Use reliable mechanical contacts capable of switching approximately 22V DC, 1 mA to close input terminals 3 and 4. (Closed: 1 kΩ maximum, Open: 100 kΩ minimum) The input terminals should not be connected to a ground wire of other devices.
- Do not install input lines in parallel with high-voltage or motor lines. Use shielded wires or separate conduit for input lines, and make the input lines as short as possible.

# Load Current

The rated current of the contact (or control output) should not be exceeded. Especially for inductive, capacitive, and incandescent lamp loads, the inrush current as large as a few to several tens times the rated current may cause welded contacts and other troubles. The amount of inrush current as well as steady-state current must be taken into consideration. • Be sure to use wires to meet voltage and current requirements and tighten M3.5 terminal screws to a tightening torque of 1.0 to 1.3 N·m. Be sure to solder the terminals correctly. Loose terminal screws or incomplete soldering may cause abnormal heat and fire.

## **Contact Protection**

Switching an inductive load generates a counter-electromotive force in the coil. The counter emf will cause arcing, which may shorten the contact life. Application of a protection circuit is recommended for contact protection.

#### **Rest Time**

When turning power off after time-out, allow a rest time of 0.1 sec, and during operation, 1 sec at least.

#### Power

Since DC types are designed to operate on DC power containing 10% or less ripple, insert a smoothing circuit when using a rectified AC power to operate DC type timers.

## **Continuous Energizing**

Continuous energizing for a long period of time may damage the electrical characteristics of the timer because of internal heating. Use an additional relay to the output circuit and refrain from continuous energizing of the timer.

# **Dielectric Strength Test**

When performing an insulation resistance or dielectric strength test on control panels containing timers, make sure that the dielectric strength of the timer is not exceeded. In case the dielectric strength is exceeded, remove the timers from the panels.

# **Operating Environment**

#### **Temperature and Humidity**

Use the timer within the operating temperature and operating humidity ranges and prevent freezing and condensation. After storing below the operation temperature, leave the timer at room temperature for a sufficient period of time before use.

#### Environment

Prevent a corrosive gas such as sulfurous or ammonia gas, organic solvents (alcohol, benzine, thinner, etc.), strong alkaline substances or strong acids from touching to the timer, and do not use the timer in such an environment. Keep the timer from water splashes or steam. **Vibration and Shock** 

Since excessive vibrations or shocks cause the output contacts to open, the timer should be used within the operating extremes of vibration and shock resistance. Use of hold-down springs is recommended for secure mounting on sockets.

#### **Others**

- Use a mechanical-contact switch or relay to supply power to the time.
- When driving the timer using a solid-state output device such as two-wire proximity switch, photoelectric switch or solid-state relay directly, malfunction may be caused by a leakage current from the solid-state device. Be sure to check thoroughly before using.
- Since AC types (such as A100 and A200) comprise a capacitive load, the SSR dielectric strength should be two or more times as large as the power voltage when switching the timer power using an SSR.
- To make a sequence circuit by connecting timer and relay, check the timer operation sufficiently in consideration of the reset time of the timer.
